

## Class Participation 1: Python Regular Expression to validate email

An email must contain @ symbol.

An email can be separated into two parts by @ symbol, a “userID” and a domain, e.g. userID@domain.

UserID can contain alphabets, numbers, and two special characters . (full stop) and – (minus/dash).

Domain might be gmail.com, hotmail.com, live.com and yahoo.com only.

File Name convention: yourNUemail.py

Note:- Write some test cases to verify and validate your code.
